Mr P Horsfield
1/227 Hoskins St
Temora
NSW 2666.

Dear Mr Horsfield.

Thank you for your letter dated 8th July 2004, which I received yesterday.

I have read with interest your information and testimonials. Unfortunately I cannot help you at this time and no staff have the time at the moment to pursue this area. I realise that you feel that the techniques are valuable and should be researched and therein lay the matter.

To undertake any research of value to you or the technique you would need to apply a rigorous research design. That is one that doesn't just take notes of results but one that uses a comparison or critically considers before and after factors. As your client group have assorted signs and symptoms it would be difficult to compare results after treatment. Only 'doing' and 'reporting' results on assorted clients would not be seen as credible or valuable to the medical community. The techniques you have been using do not seem to match current literature on anatomy or physiology but even keeping an open mind, for them to be included in any orthodox/traditional treatment regimen would need some sound clinical evidence.

I am sure if you wish to pursue this yourself, then access to CSU Wagga campus library as a community borrower would be possible and I am sure that there are many basic texts on clinical trials. It is not impossible but just complex and could be costly in time and resources.

I sincerely wish you luck and success in your endeavours.

Yours Sincerely,

Sally Ruston

*but only one cause - muscles out of alignment,
pinching nerves. Causing the various signs and symptoms!
It's so simple!*
